Projects

IOT Based Electronic Voting Machine.

- Advanced Voting System using Raspberry pi connected with IOT to avoid any malpractices.
- App authentication controlled EVM machine so that voting process can be started by an authenticated person only.
- Fingerprint sensor to recognize the person identity to avoid any fraud.
- Real-time storage of casted votes through database clouds so that there can't be any malpractice while the transportation of EVM being used in present.
- Quick declaration of election result within few minutes of post election.

Vehicle to vehicle communication to avoid accidents. Also improve traffic congestion system and road safety.

- The use of wireless communication technology can assure road safety to a great extent, as it helps collision detection, assist the driver during abnormal weather condition.
- When the system estimates for any kind of collision or crash, the driver will be alerted as the system will provide warning using buzzer, message on LCD or a voice message.
- GPS module is deployed in this system to identify the speed and location of vehicles in proximity around test vehicle, so that the driver is cautioned well in advance.
- As the blind spot area of the vehicle cannot be directly observed by the driver from his controls area due to which quick preventive action cannot be taken, thus blind spot detection system is necessary.
- The communication between vehicles will be helpful in establishing a smart parking as well.

Languages Known

English, Kannada, Hindi
Native Urdu
