

Here’s your **role-based multi-tenant architecture** in a properly formatted diagram:

📄 Fleet Management System - Role-Based Multi-Tenant Architecture

📄 Multi-Tenant Database Structure

📄 Key Takeaways

- **Super Admin** controls all tenants and has a **central metadata DB**.
- **Each Admin (Tenant)** gets a **separate DB**, isolating data from others.
- **Sub-Admins** manage only assigned corporate clients.
- **Corporate Clients** book rides under their assigned admin.

This ensures **data isolation, security, and scalability** in your **multi-tenant fleet management system**.

Would you like a **flowchart** for request handling (login, booking, etc.)?
